

Understanding Your Scores

Skills & Weaknesses

Cognitive & Academic: higher scores are stronger

Standard Score	Significantly low 69 & below	Below average 70-84	Average 85-115	Above average 116-129	Well above average 130 & up
----------------	---------------------------------	------------------------	-------------------	--------------------------	--------------------------------

Autism, ADHD, emotion and behavior rating scales: higher scores mean more concern

T Score	Not a concern 59 & below	At-Risk 60-69	Clinically Significant 70 & up
---------	-----------------------------	------------------	-----------------------------------

Adaptive rating scales: lower scores mean more concern

T Score	Clinically Significant 30 & below	At-Risk 31-40	Not a concern 41 & up
---------	--------------------------------------	------------------	--------------------------

Glossary

Standard Score
Compares the person tested with others the same age. 100 is the exact middle; 85 to 115 is average.

T Score
Compares the person tested with others the same age. 50 is the exact middle; 40 to 60 is average.

Percentile rank
The percent of same-age people who scored at or below the person tested. It is not percent correct.

At-Risk
Far enough from average to keep an eye on. It can point to an early or mild concern.

Clinically Significant
Far enough from average that support or treatment is usually recommended.
